90-Day AI Adoption Initiative

CTIPH Responsible AI Use and Human Verification

Day 90 Outcome

CTIPH will have a consistent learner-facing AI-use statement in its D2L courses and a tested disclosure and human-review process for IPE activities.

Problem Statement

CTIPH lacks consistent guidance for responsible AI use across its IPE activities, which serve thousands of health sciences students and involve faculty, facilitators, and program partners. Without shared expectations for disclosure and human verification, AI-supported work may be applied inconsistently across CTIPH D2L courses.

Target Audience

- **CTIPH Director / initiative lead.** AI fluency 4. Needs a manageable, repeatable process that fits existing D2L and IPE workflows. Key concern: added workload and a process that cannot be sustained.
- **Faculty member, IPE chair, liaison, or collaborator.** AI fluency 2 - 4. Needs clear expectations, examples, and a quick review process. Key concern: accuracy, academic integrity, role confusion, and time required for review.
- **Health sciences students in CTIPH IPE activities.** AI fluency 1 - 5. Needs plain-language rules, a meaningful non-AI option, and a simple way to disclose use. Key concern: unclear permission, unequal access, privacy, or being penalized for misunderstanding expectations.

AI Tools and Approach

AI may support drafting, editing, organization, and strategic planning. CTIPH remains responsible for accuracy, policy alignment, instructional appropriateness, disclosure expectations, and final decisions.

The initiative recommends use of Verde GenAI, for drafting, revising, summarizing, and organizing non-sensitive content. It is recommended because it provides university-governed access and supports efficient drafting while preserving human judgment and final approval. Data sensitivity is limited to

Public or Internal content only for this initiative: no names, NetIDs, grades, accommodations, survey responses, health information, or other identifiable student data. Verde GenAI is institutionally approved for the Public and Internal data.

Ethical Safeguards

- **Risk 1: Exposure of sensitive or identifiable information.**
Safeguard: Use Public or Internal content; exclude student identifiers and restricted or regulated data; confirm data category before entry.
Responsible party: CTIPH Director and every user entering content.
- **Risk 2: Inaccurate, fabricated, or misleading content.**
Safeguard: Verify factual claims, references, links, instructions, and policy statements against authoritative sources before use.
Responsible party: Content author; CTIPH Director gives final approval.
- **Risk 3: Unclear or undisclosed AI contribution.**
Safeguard: Include a standard AI-use statement and a disclosure question whose detail is proportional to the significance of AI's contribution.
Responsible party: CTIPH Director; students and collaborators disclose their own use.
- **Risk 4: AI influencing certification or participation decisions.**
Safeguard: Require human review whenever AI-supported material is used to verify IPE participation or certification requirements; AI does not make the final decision.
Responsible party: CTIPH Director.
- **Risk 5: Workflow does not fit faculty or learner needs.**
Safeguard: Obtain review from at least one named faculty member, liaison, or collaborator before finalizing the pilot workflow.
Responsible party: CTIPH Director and named reviewer.

Equity Considerations

- In practice, AI barely comes up here for students. Approximately six interprofessional students talk through an activity together, and one of six defined student roles is recording group responses. The answer is really the team's, not any one tool's. So, access to AI isn't something that affects a student's ability to participate.

Success Metrics

- **Standard AI-use statement completed**
Measured by document review against UA guidance and CTIPH needs.
Timeline: by Day 30. Minimum acceptable threshold: one approved statement ready for D2L use.

- **Stakeholder review completed**
Measured by email comments, annotated draft, or meeting notes.
Timeline: by Day 60. Minimum acceptable threshold: feedback received from at least one named faculty member, liaison, or IPE collaborator.
- **CTIPH D2L implementation completed**
Measured by the Director verifying the standard statement is posted in active CTIPH D2L course shells.
Timeline: by Day 90.
Minimum acceptable threshold: statement present in 100% of active CTIPH-controlled D2L course shells.
- **Pilot workflow completed**
Measured by whether the disclosure question and human-review checklist are used in, or fully prepared for, one selected IPE activity.
Timeline: by Day 90.
Minimum acceptable threshold: one activity implemented or pilot-ready.
- **Guidance is understandable**
Measured by a brief feedback question plus a log of clarification requests, during or immediately after the pilot. Minimum acceptable threshold: at least 80% of respondents rate expectations clear or very clear, with no unresolved privacy or permission issue.

Rollout: First Three Steps

1. **Develop:**
Finalize the CTIPH AI-use statement, disclosure question, and human-review checklist; select the pilot IPE activity and reviewer.
Who: CTIPH Director.
Resources needed: current CTIPH language, AI Champions work, UA AI guidance, and D2L access.
By Day 30.
2. **Review:**
Obtain collaborator feedback, verify alignment with current UA guidance, revise materials, and prepare D2L and pilot content.
Who: CTIPH Director and one faculty member, liaison, or IPE collaborator.
Resources needed: draft materials, reviewer time, and the UA AI Tools & Data Use Guide.
By Day 60.
3. **Implement and refine:**
Post the statement in active CTIPH D2L shells; use or prepare the pilot disclosure and review process; record questions and finalize the repeatable workflow.
Who: CTIPH Director and the selected activity collaborator, as applicable.
Resources needed: D2L access, the selected worksheet, reflection, or survey item, and a brief feedback method.
By Day 90.

50-Word Elevator Pitch (50 words)

In 90 days, CTIPH will establish consistent, practical expectations for responsible AI use across its interprofessional education courses. We will implement a standard learner-facing statement, pilot one disclosure and human-review process, protect student information, preserve non-AI options, and produce a repeatable workflow that can expand as capacity permits.

Initiative Scope and Boundaries

This initiative establishes a focused operational practice, not a campus-wide policy, comprehensive governance framework, research study, or required AI training program. It does not revise every activity-specific component at once. Expansion beyond the initial pilot will depend on results, collaborator input, workload, and capacity.

Evidence-Grounded Design

The initiative applies the Module 3 workflow practice of identifying the tool, data type, and required human check. It operationalizes the Module 5 work on transparency, accountability, human oversight, equity, and update needs. Current University of Arizona guidance also supports clear instructor expectations, disclosure, appropriate tool selection, and data-sensitive use.

Core Deliverables

- A concise CTIPH AI-use statement implemented in active CTIPH D2L course shells.
- One AI-use disclosure and verification question for a selected IPE worksheet, reflection, or post-event item.
- An internal human-review checklist for AI-supported student- or facilitator-facing materials.
- Documented review from at least one named faculty member, liaison, or IPE collaborator.
- A refined workflow that can be extended to other IPE activities when capacity permits.
