

AI Workflow Canvas

1. Task entry point: What triggers this workflow? What is the desired output?

This workflow is triggered when CTIPH needs to create or substantially revise an IPE learner Team worksheet. The desired output is a learner-facing worksheet with structured team discussion prompts aligned with the event agenda, D2L content, and learning goals.

2. Data inputs: What information goes in? Data sensitivity classification (Low/Med/High):

Inputs include the event agenda, learning outcomes, learner worksheet examples, PPT slides, panel discussion topics, and instructional goals. Data sensitivity is Low because the materials do not include student records, grades, or other personally identifiable information.

3. AI tool selected & rationale: Why this tool for this task? Is it institutionally approved?

Claude was used to support drafting, organization, formatting, and revision of the learner worksheet. The tool was selected for its ability to generate instructional documents, generate structured discussion questions, and revise drafts based on specific feedback. Institutional approval status should be confirmed before use for any sensitive, restricted, or confidential information.

4. Prompt strategy: What prompting approach (zero-shot, few-shot, CoT)? Role specification?

The prompt strategy was a few-shot, iterative revision approach. I provided source materials and examples of the desired output. The role was specified as a curriculum/worksheet design assistant. Follow-up prompts narrowed the draft by requiring alignment with the event agenda, referencing Cases A, B, and C, removing questions that were too broad, and limiting content to the PPT.

5. AI output review checkpoint: What specifically do you check? For accuracy? Tone? Bias? (If applicable, include a rubric or checklist):

The AI output is reviewed for agenda alignment, case accuracy, correct use of learner roles, alignment with learning goals, clarity, and completeness. I also check that the questions are not too broad, do not introduce clinical content, and focus on interprofessional learner discussion rather than individual clinical decision-making.

6. Human verification step (REQUIRED): What human action confirms quality before the output is shared?

Human verification is non-negotiable. I compare the drafts and final worksheet line-by-line against the event agenda, D2L content, and prior CTIPH worksheet examples. I confirm that all required case-based questions are included, and that the final version reflects CTIPH's instructional intent before it is posted or shared. The tool supports drafting and organization, while CTIPH retains responsibility for judgment, accuracy, scope, and quality.

7. Output and disclosure decision: Format, destination, and disclosure action:

The final output is a learner-facing Team Worksheet posted in D2L and/or included with event material development or revision. Some instructional materials for this event were revised with support from graphics, images, organization, formatting, and/or revision. All final materials were reviewed, edited, and approved.

Disclosing AI Use: If AI is used in any manner, please acknowledge and describe how it was used in

Worksheet for a specific event. The desired output is a D2L case materials, PowerPoint flow, scripts/video content,

list/facilitator scripts, D2L case descriptions, and cases, PHI, or confidential learner information.

The tool was selected because it can synthesize multiple specific feedback. Only low-sensitivity instructional content was student-identifiable data.

?
examples, then directed the AI to act as an IPE facilitator with the agenda, beginning with Team Huddle/Role Play content to what was actually presented in the scripts, video,

Completeness?

ent with the PowerPoint/story arc, appropriate scope, tone, and teaching beyond the event materials, and are appropriate

What is used?

the event agenda, PowerPoint, D2L case materials, and questions are included, that no unsupported clinical content is shared with learners. This is a centaur-style workflow: AI-generated content, review, and final approval.

ials. A disclosure statement is added when AI assisted with generative AI tools. AI was used to assist with creating oved by CTIPH before being shared with learners.
the Team Worksheet.
